

EXPERIMENT-2

OBJECTIVE: For a given set of training data examples stored in a .CSV file, implement and demonstrate the Candidate-Elimination algorithm to output a description of the set of all hypotheses consistent with the training examples.

PURPOSE: The CANDIDATE-ELIMINATION algorithm computes the version space containing all hypotheses from H that are consistent with an observed sequence of training examples .Notations:

D - Training data set

X - Set of instances with in training data set

x - particular instance in training example

H - Set of possible hypothesis

G- Set of maximally general hypothesis

S- Set of maximally specific hypothesis

h - particular hypothesis described by conjunction of constraints on the attributes

ai - constraint attribute of hypothesis, ai can have a value of 0 (no value), or any value(ai=sunny), or? (any value)

c - target concept

Candidate-Elimination Algorithm:-

Step1:- Load Data set

Step2:- Initialize General Hypothesis and Specific Hypothesis.

Step3:- For each training example

Step4:- If example is positive example

 If attribute_value == hypothesis_value:

 Do nothing

 Else:

 Replace attribute value with '?' (Basically generalizing it)

Step5:- If example is Negative example

 Make generalize hypothesis more specific.

PROGRAM:

```
import numpy as np
import pandas as pd
data = pd.read_csv('data.csv')
concepts = np.array(data.iloc[:,0:-1])
print(concepts)
target = np.array(data.iloc[:,-1])
print(target)
def learn(concepts, target):
    specific_h = concepts[0].copy()
    print("Initialization of specific_h and general_h")
    print(specific_h)
    general_h = [["?" for i in range(len(specific_h))] for i in range(len(specific_h))]
    print(general_h)
    for i, h in enumerate(concepts):
        print("For Loop Starts")
        if target[i] == "yes":
            print("If instance is Positive ")
            for x in range(len(specific_h)):
                if h[x] != specific_h[x]:
                    specific_h[x] = '?'
                    general_h[x][x] = '?'
        if target[i] == "no":
```

```

print("If instance is Negative ")
for x in range(len(specific_h)):
    if h[x] != specific_h[x]:
        general_h[x][x] = specific_h[x]
    else:

print("\n")
indices = [i for i, val in enumerate(general_h) if val == ['?', '?', '?', '?', '?', '?']]
for i in indices:
    general_h.remove(['?', '?', '?', '?', '?', '?'])

s_final, g_final = learn(concepts, target)
print("Final Specific_h:", s_final, sep="\n")
print("Final General_h:", g_final, sep="\n")

```
